

# IDS LAUNDRY BAGS

## Water soluble bags, 100% Biodegradable

### Processing of contaminated clothes

Contaminated clothing is indeed a major problem in all health institutions. They are manipulated a variable number of times, from bed changes ... to laundries, thus contributing to the spread of possible infections (inside or outside these institutions) and representing an extremely high risk.

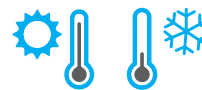

A **IDS** introduces the **IDS Laundry Bags**, that allow clothes to be handled only once. When the clothes are put in the bags, they are closed and can be put directly into the washing machines as they will be completely dissolved, being **100% biodegradable**, leaving absolutely no residue (even on the most delicate clothes). They are **completely safe** even when in they come into contact with the skin, food, medications, etc. The bags, once closed, can be manipulated as often as necessary and are only dissolved in contact with hot water (above 40 °C).
